

SIEMENS

SIEMENS DIGITAL INDUSTRIES SOFTWARE

Engineering robots for the future

Dawn of the industrial robots

1954 First industrial robot patent

1957 Planobot
Loading and unloading of hot castings

1961 Unimate
Auto industry - transported die castings, tedious, dangerous tasks, high-quality welds in somewhat inhospitable condition

1969 First spot welding robots

1979 Assembly robots - Electronics & semiconductors, miniature assembly, precision, throughput & contaminants protection

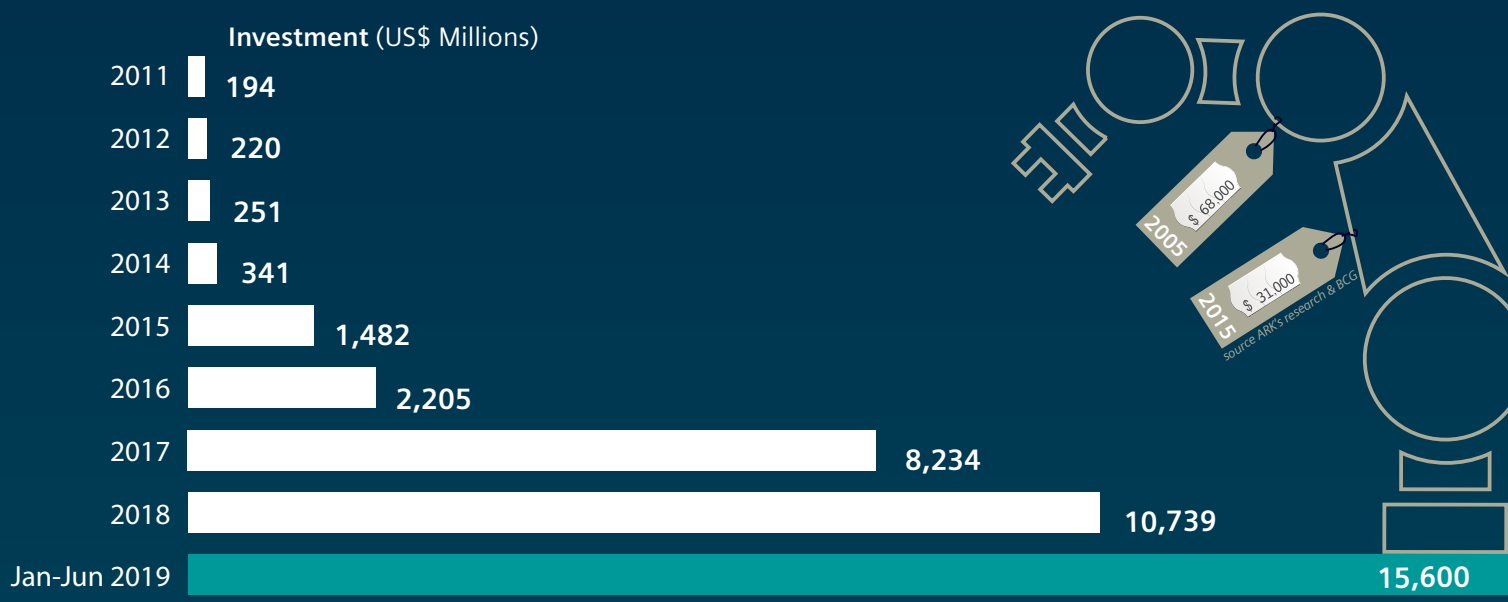

1992 Delta robots
Parallel robot for the packaging industry

2013 COBOTS
Collaborative robots

Fast changing robotic industry

40%
growth of the number of robotics-related innovation patents
2005-2015

25%
CAGR in
last three years

Embrace future co-workers: Robots

4 million
industrial robots are expected to work in factories worldwide by 2022

Industrial composition of robot stock

Industrial robots shipment 2017

Resource drain
+500,000
manufacturing jobs were going unfilled

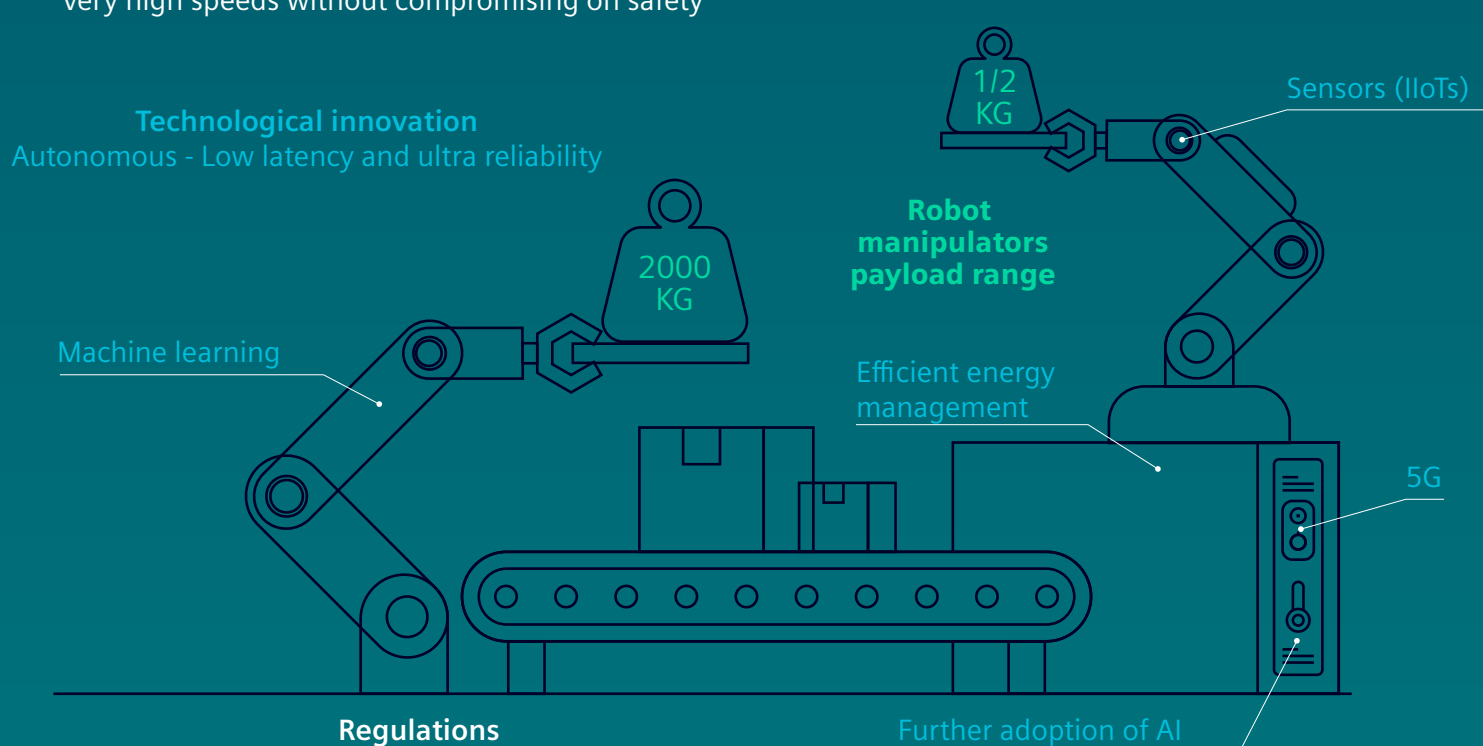

27%
percent of the manufacturing workforce 55 or older

+10,000
baby boomers were retiring each day

Unlock robotics adoption

Performance - Flexibility to produce small batches of customized products with high degrees of precision and at very high speeds without compromising on safety

ROI < 2 years

Taking control of the complexity and cost

Kinematics

"With every new project, we start with our skeleton or envelope design and perform feasibility studies."

E2M Technologies

Structural

"With breakthroughs in both structural design and autonomous control systems, we submitted two applications for national patents."

Siemens and Aucma

Dynamics

"Virtually modeled Curiosity's components, assemblies and systems, and simulated their performance under a variety of conditions."

Jet Propulsion Laboratory

Precision

"Identifying different resonance frequencies that occur when the production line accelerates to minimize/prevent vibrations"

Agfa Graphics

Thermal analysis

"Verified accuracy of design values for thermal parameters by directly measuring the resulting thermal resistances and capacitances."

Yaskawa Electric

Durability

"Virtually simulate the behavior of a component or complete structure when subjected to specific loads and constraints."

Mecalac

Security

"Developing and validating the control and software strategies for any situation and environment is key for safety-critical functions and necessitates the use of closed-loop simulation."

Twinswheel

Regulation

"Our machines are subject to very strict security rules as they work in interaction with the public, spectators and operators."

La Machine

Integration

"Comprehensive and detailed system knowledge is essential to faster and better product innovation."

Parker Hannifin

Energy efficiency

"Provide a detailed representation of energy behavior for each component while integrating with the global machine's multiphysics environment."

Picanol

Optimization

"Analyze hundreds of designs to choose the best compromise."

CAE Value

Virtual Commissioning

"The software and hardware need to be developed in sync to achieve required hardware costs and system performance."

Twinswheel
